The Greenhouse Effect

Some solar radiation is reflected by the Earth and the atmosphere.

Some of the infrared radiation passes through the atmosphere, and some is absorbed and re-emitted in all directions by greenhouse gas molecules. The effect of this is to warm the Earth's surface and the lower atmosphere.

Solar radiation passes through the clear atmosphere

Most radiation is absorbed by the Earth's surface and warms it.

Infrared radiation is emitted from the Earth's surface.
Northern Hemisphere Carbon Emissions

Carbon Emissions

- Fossil-fuels (Gt C)
- Land-use Change (Gt C)

Sinking infrastructure in Russia
Thinning of the Arctic sea-ice

The height of the bars represent the reduction of ice thickness (draft) from the period 1958-1976 to 1993-1997.

Location of the sampling points:
- Beaufort Sea: -0.9 meter
- Chukchi Cap: -0.9 meter
- Canada Basin: -1.3 meter
- North Pole: -1.4 meter
- Nansen Basin: -1.7 meter
- Eastern Arctic: -1.8 meter

Ice draft in the 90s is over a meter thinner than three decades earlier.

Thinning of the Arctic sea ice cover:

- All regions together:
  - Thickness of the ice for the period 1958-1976
  - Thickness of the ice for the period 1993-1997

Note: Comparison of sea-ice draft data acquired on submarine cruises between 1993 and 1997 with data from 1958-1976 indicates that mean ice draft at the end of the melt season has decreased by 1.3 m (from 3.1 m to 1.8 m). Value is down by 40%.

Polar bears stranded on ice
Climate Change
If you are a land manager, by now there is a good chance that:

A. you have been bored silly with the number of times you have seen dire climate change predictions but not sure how polar bears will impact your job

B. you are really concerned that climate change is occurring but not sure what to do about it because the issue seems too big to deal with

C. think this is all a bunch of BS and you are only listening because your supervisor told you to
The standard off the shelf climate change presentation ... is not effective with land managers.
So what to do??!!
Try a different approach
Reaching Common Ground: Communicating the Impacts and Options of Climate Variability for Working Land Managers

Steven McNulty
smcnulty@fs.fed.us
Try the ELFLAND Approach

- Establish contact
- Listen
- Find commonality
- Lessen mistrust
- Assess needs
- Nurture ongoing projects
- Deliver
An example using the Southeastern US
1. Establish Contact

- Huge network of climate information tool and data providers already exists for the SE. Examples include:
  - NRCS staff for each county
  - State Extension
  - South East Climate Consortium
  - Southern Group of State Foresters
  - Southeast Climate Science Center
  - LCCs (9 are part of SE region)
  - Delta Farm Press
  - Southeast Farm Press
  - Minority Landowner Magazine
  - CISA
2. Listen

• Attend a lot of meetings and eat lots of BBQ
  – listen to meeting topics and concerns
• Host webinars to solicit input
  – a series of a dozen webinars were conducted to hear from land managers and TAIP (Tool Assistance and Information Providers)
• Contact tool and information developers to hear what they have already developed or could develop with additional assistance
3. Find Commonality

• 90% of southeast foresters do not believe in AGW

• The percentage of (non-organic) southeast farmers believing in AGW is likewise very low
  – However, all believe in climate variability
    • so use a "ice breaker survey"
A quick survey

Q1. Has climate always varied in the past, will climate always vary in the future, and would we experience climate variability now regardless of anything that people may or may not do?

Foresters yes USDA yes

Q2. Is current climate variability negatively impacting some forests?

Foresters yes USDA yes

Q3. Will future climate variability likely impact forests in the future?

Foresters yes USDA yes

Q4. If you could manage your forests to better adapt to current and future climate variability would you?

Foresters yes USDA yes
4. Lessen Mistrust

• Most (if not all) of audience now considers the presenter to be tricky and expects that climate change will soon become the center of discussion
  – So begin by showing national variability of drought
  – Followed by a map illustrating that they are (largely) correct in believing that warming has not occurred in the South
    • This elicits much smiling and head bobbing
    • It also elicits a sense that the presenter is giving a "fair and balanced" presentation
Who to believe?

The scientists who study the climate
9,135 out of 9,136 scientists (99.999%) believe man-made climate change is happening based on study of peer reviewed papers published between 2011 and 2013.

LINDSAY ABRAMS

The foresters who live and work in the climate every day
Recent PINEMAP Survey: Only 10% of surveyed southeast foresters thought that man-made global warming was occurring.

Laura Edwards
Western Regional Climate Center

http://droughtmonitor.unl.edu/
Trends in Extreme Precipitation

Increase in the number of 2” rainfalls per year from 1958 to 2011
You don’t need warming to have major disasters

Billion Dollar Weather/Climate Disasters

1980 - 2012

Alaska - 3
Hawaii - 1
Virgin Islands - 3
Puerto Rico - 4

Number of Events

1 - 8  9 - 16  17 - 25  26 - 35  36 - 44  45 - 54
5. Assess Needs

• Acknowledge that despite the lack of temperature increase in the Southeast, there is much climate variability

• For this and other reasons, the Southeast region leads the nation in $billion+ disasters

• Present the variability and discuss the problem that this variability is causing on working land sustainability and operation
Needs Include

• Better forecasting of seasonal climate
  – for ordering seed type
  – for harvest and planting schedules
  – for controlled burning

• Better forecasting of local conditions

• Better alert systems
El Niño and La Niña

El Niño is associated with unusually warm water in the eastern Pacific Ocean, usually observed near Christmas (so associated with the coming of “The Child”). La Niña is the opposite phase of El Niño, with unusually cool water in the eastern Pacific Ocean.
El Niño and La Niña

Precipitation

- El Niño
- La Niña
6. Nurture Projects

• Many good tools are already available from private, state, and federal groups
  – expand geographic range (e.g., Agroclimate)
  – expand easy access through app development
  – expand number of species for application
• Other tools could be jointed together to form a better single tool (e.g., control burning index and emissions dispersal)
• Other tools could be developed but need coordinated leadership (e.g., TAIP alert system)

• Currently assessing existing tools and databases
7. Deliver

• Follow up with TAIP and land managers regarding their needs and product deliverables
• Listen to their thoughts and concerns regarding tool effectiveness and be prepared to work with tool developer on additional modifications
• Continue to assess the situation for change and further development
Conclusions

There is a BIG difference between giving a one time “information sharing” presentation to the local garden club and land managers.

- With land managers, you need to build a trusting relationship before many are willing to take REAL action.

Do NOT focus on the cause or the trend of climate.

Do NOT drone on about the impacts of “climate change” – instead talk about the impacts of too much or too little rain, timing of rain, and interactions with other Stresses.

Try to be entertaining. For many, the topic of climate change is like a bad movie you are forced to watch again and again.

Don’t be surprised if your first (second, third) attempt at communication fails. Land managers are a tight community, and you are presenting information that is not necessarily welcome. Build the relationships in a non-threatening way.

Remember that your work is extremely important so DON’T GIVE UP!
